

Workshop on Building Research and Educational Programs for Scientists and Engineers Based on International Telecommunications and Internet

January 10 (Tue), 2006
At Chiba University's Nishi-Chiba Campus, Japan

Final Circular

We welcome everyone from both academic/educational institutions and the industry.

We encourage students, researchers and faculties of any nationalities to join.

This workshop is held in English.

In recent years, the use of online educations and collaborations based on video-conference and internet has been increasing rapidly by connecting several locations on the globe at real time. Yet the video conferencing system remains expensive, and in today's market with full of product information, it is difficult to choose right gears, software and service providers of less expensive collaborative systems.

The objectives of this workshop are (1) to discuss among participants benefits and challenges in building cost-effective international collaborative programs, including the use of *E-TEAM Learning System* Chiba University has developed, among universities in different countries, and (2) to establish nuts and bolts of the programs to achieve the best results and efficiency. We aim to promote the advantages of both scientific/technical knowledge AND international communication skills of the program participants.

The workshop includes exhibitions of IT products and telecommunication services from the industry, and international cultural shows at the reception dinner on January 10, 2005. No registration fee is required.
